

Taylorism is a system of scientific management, developed by the father of scientific management, Fredrick Winslow Taylor, 1856-1915. This occupational management system bequeathed by Taylor was indoctrinated into American life and the world, whereas “the application of scientific methods to the problem of obtaining maximum efficiency in industrial work or the like”, (Kanigel, 1997, pg 7). Concerning education, New Taylorism has detached teachers from being personally instructive in the classroom and has become more atomistic; high stack testing and curriculum standardization changed the landscape of teaching expertness and has given control to the “technical expert” outside the classroom.
